We noticed after publication that wrong parameters of the thermistor were used to calculate the cell temperature given in the Letter. The actual temperature during the experiments was 26.0 °C, with fluctuations typically of the order of a few mK, measured by thermistors placed at three different positions close to the cell. This correction does not alter the fact that the temperature was maintained constant in the whole course of the experiments, and does not affect any conclusion made in the Letter.
